

ULTIMATE REAL-TIME DATABASE PROTECTION

- ✓ Data Audit, Database Firewall, Dynamic and Static Data Masking, Sensitive Data Discovery – all in one
- ✓ Achieving compliance with widespread security standards such as SOX, PCI DSS, HIPAA, GDPR, ISO27001
- ✓ Continuous database traffic monitoring to/from database servers
- ✓ Prevention of SQL injection attacks
- ✓ Protection in the cloud and on-premises across multiple data silos
- ✓ Heterogeneous database support with centralized management
- ✓ Self-learning engine included
- ✓ Integration with third-party SIEMs and system management solutions
- ✓ Custom role-based security policies
- ✓ Authentication proxy, High Availability, Fail-over
- ✓ Client application user translation, audit and security
- ✓ Enhanced health check
- ✓ On-the-fly data encryption
- ✓ Integration with CyberArk, Splunk and RSA

DATA MASKING

Both Dynamic and Static Data Masking included.

Prevention of accidental data leaks by obfuscating the output from protected databases.

A variety of prebuilt masking algorithms and the possibility to use custom functions for masking.

DATA SECURITY

Analyzing and monitoring of database traffic.

Protection from unauthorized queries and SQL injections in real-time.

Notifications and report generation on detected threats to IT Security and DevOps.

DATABASE ACTIVITY MONITORING

Tracking of all user actions, queries and changes made to databases in real time.

Advanced Audit Compliance Reporting Platform.

Revealing and preventing data leaks.

Application user translation.

SUPPORTED DATABASES

Amazon RDS	Amazon DynamoDB	Amazon Redshift	Amazon Aurora
Oracle	Teradata	SAP HANA	Vertica
PostgreSQL	Hive	Greenplum	Netezza
MySQL	Cassandra	Impala	MS SQL Server
IBM DB2	MongoDB	MariaDB	and more...

*All other product names mentioned are used only for identification purposes and may be registered trademarks of their owners

HOW IT WORKS

DataSunrise Database Security includes:

- Data Audit for database activity monitoring
- Data Security to secure your database against unauthorized access attempts and SQL injection attacks
- Dynamic Data Masking for obfuscation of database output in real-time
- Static Data Masking enables creating of a perfect test environment out of your production database

Traffic processing control is based on a system of security policies (Rules) configured by an administrator. The Rules

define DataSunrise actions (auditing, blocking, masking etc.) and events that trigger these actions. Each functional module has its own system of Rules.

Database traffic intercepted by DataSunrise undergoes two-stage analysis. At first DataSunrise picks out SQL queries, execution results and other information. Queries that match conditions defined by existing security policies undergo detailed investigation: DataSunrise determines names of database elements queries directed to, query results, session details and other valuable information. Then DataSunrise applies existing security policies: audits the traffic, blocks SQL-injected queries or obfuscates query results.

DATASUNRISE DEPLOYMENT

DataSunrise can be deployed in the cloud or on-premises, installed locally on a database server or on a separate machine. Depending on deployment scheme, DataSunrise can operate in the following modes:

Proxy mode

Database clients connect to the database through DataSunrise proxy. DataSunrise can block or modify queries before redirecting them to the database. DataSunrise can be configured as a reverse proxy as well.

Cloud Watch

DataSunrise can be integrated with Amazon CloudWatch to display DataSunrise-associated metrics and create alarms.

HIGH AVAILABILITY AND AUTO SCALING

When installed in this configuration, all DataSunrise servers use a common Dictionary storage that can be monitored and controlled from any machine. DataSunrise can be paired with a Load Balancer of some kind for Auto Scaling.

Compliance Automation

The Compliance Manager feature provides automated data and database security according to national and international regulatory requirements (HIPAA, GDPR, PCI DSS, SOX and ISO 27001).

AWS Cloud Formation

DataSunrise provides a dedicated script for deployment of HA environment for Amazon cloud service based on AWS CloudFormation. All objects are created automatically without user interference.
